Nail Surgery consent form

The intended benefits. To use local anesthetic injection to numb the toes, then remove the ingrown nail and destroy the root matrix with acid to prevent regrowth .

The toe will need redressing every 48 hours for approximately 3 weeks following surgery, in people with a low healing rate this may require re-dressings for up to 8 weeks.

Patients with a compromised immune system (i.e. MS, Lupus disease etc) will have a lower expected outcome and longer recovery time.

By signing this document, you (the patient) agree to the above and that you have no known allergy to local anesthetic.

To be completed by the patient.
